#### Abstract

A series of 2-(5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazole-3-ylthio)-N-(substituted benzylidene) acetohydrazides (5a-5l) have been synthesized via condensation of 2-(5-(6-Bromo-2-methyl-4-oxaquinazolin-3 (4H)-yl)-4H-1,2,4-triazole-3-ylthio)acetohydrazide (4) with different aromatic aldehydes. Cycloaddition of thioglycolic acid with $5 \mathrm{a}-5 \mathrm{l}$ yielded 2 -[5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazol-3-ylthio]-N-(substituted benzylidene)-4-oxothiazolidin-3-yl) acetamides (6a-6I) while compound 5a-5l on treatment with chloro-acetylchloride in the presence of triethylamine are converted into 2-[5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazol-3-ylthio]-N-(3-chloro-2(substituted benzylidene)-4-oxoazetidin-1-yl) acetamides (7a-7l).The structure of all the newly synthesized compounds have been confirmed by elemental analysis and spectral studies (IR, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and mass spectroscopy).Compounds 5a-5I,6a-6l and $7 a-7 l$ have been evaluated for their anti-inflammatory and analgesic activity and were compared with the standard drug phenylbutazone. The most active compound of this series is 2-[5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazol-3-ylthio]-N-(3-chloro(2,6-dichloro benzylidene)-4-oxoazetidin-1-yl) acetamide (7g).

KeYwords: Thiazolidinonyl quinazolinone; Azetidinonyl quinazolinone; anti-inflammatory activity; Analgesic activity; acute toxicity.

## Introduction

Quinazolinone nucleus has been gaining prominence due to the fact that its derivatives have been found to possess wide spectrum of activities like anti-becterial ${ }^{1,2}$ analgesics ${ }^{3}$, anticonvulsant ${ }^{4}$ and anti-inflammatory ${ }^{5-8}$. However, we have also reported substituted quinazolinone ${ }^{9,10}$ derivatives as potent anti-inflammatory and analgesic inhibitors. Substitution pattern by different aryl or heteroaryl moieties at $2 / 3$ position ${ }^{11,12}$ of quinazolinone nucleus markedly influence anti-inflammatory activities. Moreover, Thiazolidinones ${ }^{13-15}$ Azetidinones ${ }^{16,17}$ and Triazole ${ }^{18,20}$ are other important pharmacodynamic heterocyclic nuclei which when incorporated in different heterocyclic templates have been reported to possess potent antiinflammatory activity. In the light of the above observation we have synthesized a new series of quinazolinone derivatives by incorporating the Triazole, Thiazolidinone and Azetidinone moieties at $3^{\text {rd }}$ position of the quinazolinone nucleus. All the compounds have been screened for their anti-inflammatory, analgesic and ulcerogenic activities.

## Chemistry

The started compound 5-Bromo anthranilic acid has been synthesized according to the method of wheeler (1910). Compound 6-Bromo-2-methyl-4H-benzo [1,3]oxazin-4-one (1) have also been prepared by known method of Bogert et al (1907). Reaction of 5 -amino- $4 \mathrm{H}-1,2,4$-triazole-3-thiol in dried pyridine with 6 -Bromo-2-methyl-4H-benzo[1,3]oxazin-4-one carried out to obtain compound (2), which on reaction with chloro acetyl chloride resulted into 2-(5-(6-Bromo-2-methyl-4-oxaquinazolin-3(4H)-1,2,4-triazole-3-ylthio) acetyl chloride (3). Compound (3) when refluxed with $99 \%$ hydrazine hydrate in absolute ethanol yielded 2-(5-(6-Bromo-2-methyl-4-oxaquinazolin-3 (4H)-yl)-4H-1,2,4-triazole-3-ylthio) acetohydrazide (4).

Compound (5a-5I) have been synthesized by condensation of compound (4) with various aromatic aldehydes in the presence of $2 \% \mathrm{NaOH}$ solution. Addition of thioglycolic acid in the presence of anhydrous $\mathrm{ZnCl}_{2}$ followed by cyclisation in compounds (5a-5l) introduced the Thizolidinone moiety in these compounds i.e. 2-[5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazol-3-ylthio]-N-(Substituted benzylidene)-4-oxothiazolidin-3-yl) acetamides (6a-6I), while compounds 5a-5l when refluxed with chloro acetyl chloride in the presence of triethyl amine resulted into compounds 2-[5-(6-Bromo-2-methyl-4-oxoquinazolin- $3(4 \mathrm{H}$ )-yl)-4H-1,2,4-triazol-3-ylthio]-N-(3-chloro-2-(Substituted benzylidene)-4-oxoazetidin-1-yl) acetamides (7a71).

## Pharmacology

The experiment were performed with albino rats of Charles-Foster strain of either sex, excluding pregnant females, of 60 to 90 days weighing 100 to 120 g . Food (chaw pallet) and water was given to the animals ad libitum. The test compounds were dissolved in propylene glycol. Indomethacin and phenylbutazone were used as reference drugs for the comparison of anti-inflammatory, analgesic and ulcerogenic activity.

## Anti-inflammatory activity against carrageenan-induced rat's paw oedema

This study was done by following the procedure of Winter et al. [1962]. The rats were divided into three groups (control, drug treated, and standard, drug of six animals each. A freshly prepared suspension of carrageenan ( $1 \%$ in $0.9 \%$ saline) 0.05 ml . was injected under the planter aponeurosis of the right hind paw of each rat. Test compounds and standard drug were administered orally to the animals of drug treated groups and the standard drug group, respectively 1 h before the carrageen an injection. The paw volume of each rat was measured before 1 and after 3 h of carrageenan treatment with the help of a plethymometer. The percent anti-inflammatory activity was calculated according to the formula given below-

Percentage of inhibition of oedema $=\left(1-V_{t} / V_{c}\right) \times 100$
Where, $\mathrm{V}_{\mathrm{t}}$ and $\mathrm{V}_{\mathrm{c}}$ are the mean increase in paw volume of rats of the treated and the control group, respectively. Results obtained were statistically analyzed.

## Analgesic activity

Following the method of Berkowitz et al. [1977] performed this activity. This method is based on the property of the test compound to antagonize the phenyl quinone-induced pain syndrome in mice. Groups of five mice were injected intraperitonely with 0.25 ml of a $0.02 \%$ solution of phenylquinone in ethanol (5\%) 1 h after of oral administration of the test compound. The number of writhes induced in each mouse was counted for 5 min (between 5 and 10 min ) after injection of an irritant. The analgesic effect was expressed as percent protection in comparison to control.
$\%$ protection = (1-mean no. of writhes in mice of test groups/mean number of writhes in mice of control group) $\times 100$

## Ulcerogenic activity

Ulcerogenic liabilities of newly synthesized compounds were checked with method of Verma et al [1981]. Albino rats were fasted for 24 h prior to drug administration. All animals were sacrificed 8 h after drug treatment, and their stomachs and small intestines were microscopically examined to assess the incidence of hyperemia, shedding of epithelium, Petechial and frank hemorrhages and erosion or discrete ulceration with or without perforation. The presence of any one of these criteria was considered to be an evidence of ulcerogenic activity.

## Acute Toxicity study

The test compounds were investigated for their acute toxicity ( $\mathrm{ALD}_{50}$ ) in albino mice, according to the method of Smith [1960]. The test compounds were given orally at different dose levels in separate groups of animals. After 24 h of drug administration, percent mortality in each group was observed. $\mathrm{ALD}_{50}$ was calculated from the data obtained.

## Pharmacological result and discussion

All the newly synthesized compounds were studied for their anti-inflammatory activity against carrageenan-induced oedema. All the compounds were tested at a dose of $50 \mathrm{mg} / \mathrm{kg}$ given orally. The results of the study have shown in table-I, II, \& III. All the compounds of this series (5a-5I), (6a-6I) and (7a-7l) have shown varying degree of anti-inflammatory activity (10.12-45.76\%). The active compounds of this series 6 g and 7 g were found to possess more potent anti-inflammatory activity in the comparison of phenyl butazone. The compound $\mathbf{6 g}$ i.e. which substituted with chloro group at 2,6 ,-position have shown $40.69 \%$ of inhibition of oedema. The compound 5 a , which possessed chloro group at $2^{\text {nd }}$-position has shown least activity i.e., $10.12 \%$. The compound ( 6 g ) 2-(5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazole-3-ylthio)-N-(2-

Synthesis of some new substituted azetidinonyl and thiazolidinonyl quinazolon-4(3H)-ones as potential non-steroidal anti-inflammatory and analgesic agents
(2,6-dichloro benzylidene)-4-oxothiazolidin-3-yl) acetamide and (7g) 2-(5-(6-Bromo-2-methyl-4-oxoquinazolin-3(4H)-yl)-4H-1,2,4-triazol-3-ylthio)-N-(3-chloro-2-(2,6-dichloro phenyl)-4-oxoazetidin-1-yl) acetamide, have shown the better antiinflammatory activity i.e. 40.69 and $45.76 \%$ at a dose of $50 \mathrm{mg} . / \mathrm{kg} . \mathrm{p} . \mathrm{o}$. as compared to phenyl butazone, figure-I showed the bar diagram of anti-inflammatory activity at three graded doses ( 25,50 , and $100 \mathrm{mg} / \mathrm{kg}$ p.o.) of compounds $\mathbf{6 g}, \mathbf{7 g}$ and phenyl butazone. At all the three dose levels compounds $\mathbf{6 g}, \mathbf{7 g}$ showed more inhibitory activity than that of phenyl butazone.

The newly synthesized compounds of the present series showed analgesic activity varying from 8.35-42.37 \%. The active compound of this series $\mathbf{6 g}$ and $\mathbf{7 g}$ were found to possessed better analgesic activity i.e. ( 38.54 and $42.37 \%$ ) at the dose of 50 $\mathrm{mg} / \mathrm{kg}$ p.o. Considering, potentiality of compound 6 g and $\mathbf{7 g}$, these were studied in details at three graded doses 25,50 and $100 \mathrm{mg} / \mathrm{kg}$ p.o. The compound 7 g have shown better analgesic activity at all three graded doses of 25,50 and $100 \mathrm{mg} / \mathrm{kg}$ p.o as compared to phenyl butazone Figure-IV

Compound $\mathbf{6 g}$ and $\mathbf{7 g}$ were also tested for their ulcerogenic activity and found to be less ulcerogenic liability as compared to phenyl butazone. ${U D_{50}}$ of compound 6 g is $165.5 \mathrm{mg} / \mathrm{kg}$ i.p. and compound 7 g is $195.5 \mathrm{mg} / \mathrm{kg}$ i.p. $\mathrm{UD}_{50}$ of phenyl butazone is $66.6 \mathrm{mg} . / \mathrm{kg}$. i.p.

Approximate lethal dose ( $\mathrm{ALD}_{50}$ ) of all compounds of the present series showed $>1000 \mathrm{mg} / \mathrm{kg}$. p.o. The compound $\mathbf{6 g}$ and $\mathbf{7 g}$ have exhibited $>1400 \mathrm{mg}$./kg. p.o., it indicates a good safety margin.

## EXPERIMENTAL

All reagents and solvents were generally used as received from the commercial supplier. Reactions were routinely performed in oven-dried borosil glassware. The melting points of compounds were determined in open capillaries with the help of thermionic melting point apparatus and were uncorrected. The progress of the reaction is monitored by TLC and product are purified through recrysttalization and purity of the compounds was checked by thin layer chromatography (TLC) performed on silica gel G coated plate of 0.5 mm thickness. The eluent was a mixture of different polar and nonpolar solvents in different proportions, and spots were visualized under iodine chamber. The IR spectra were recorded on Perkin Elmer 881 FTIR spectrophotometer ( $\square_{\text {max }}$ in $\mathrm{cm}^{-1}$ ). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were recorded in $\mathrm{CDCl}_{3}$ and DMSO- $\mathrm{d}_{6}$ on Brucker DRX-400/300 FTNMR instrument. Mass spectra were determined on JEOL JMS-D-300 instrument.

Elemental and spectral analyses of the compounds were obtained from sophisticated, Analytical Instrumentation Facility Chandigarh, Punjab and CDRI, Lucknow, India.
